

Cyclistic Bike-Share:

How Do Annual Members and Casual Riders Differ?

Presented by: Daniil Morozov

Date: 10.07.2026

Table of Contents

- Objective
- Analysis
- Conclusions & Recommendations
- Appendix

What is the objective?

Objective

Identify **behavioral differences** between **casual riders** and **annual members** of Cyclistic bike-share to support a marketing strategy aimed at converting casual riders into annual members.

What does the data say?

Trip Duration

- **Casual riders take longer trips** on average compared to annual members
- **Median values are lower** than averages for both groups, indicating a small number of very long rides skews the data upward

Trip Duration	Casual Rider	Annual Member
Average	19.15 min	12.12 min
Median	11.43 min	8.68 min

Type of Bike

- Both groups **prefer electric bikes** over classic bikes
- **Annual members** account for nearly twice the total number of rides compared to casual riders across both bike types

Peak Hours

- **Annual members** peak sharply at **8AM and 5PM**
- **Casual rider** volume grows gradually **throughout the day** with no morning spike

Peak Days

- **Annual members** ride most consistently on **weekdays**, with usage dropping on weekends
- **Casual riders** peak on **Saturday and Sunday**

Popular Start & End Stations

- **Casual riders** concentrate at **tourist destinations**
- **Annual members** use urban **commuter intersections**
- Trend holds true **for both** the beginning and end of trips

5 Most Popular Stations for
Casual Riders

5 Most Popular Stations for
Annual Members

What are the conclusion and
recommendations?

Conclusions

1

Casual riders peak on weekends, ride in the afternoon, and concentrate at tourist destinations and parks

2

Annual members ride consistently throughout the week, peak during morning and evening rush hours, and use commuter station locations

3

The data suggests that annual members use bikes for **commuting**, while casual riders use them **recreationally**

Recommendations

1

Conduct an Incentivized Demographic Survey: Implement a brief in-app questionnaire to collect missing user data, such as age, gender, and occupation, to build accurate customer personas. To drive high participation rates, offer users a benefit, e.g. a free 15-minute ride credit upon completion of the survey

2

Introduce a Weekend-Only Subscription Tier: Create a new, lower-cost subscription plan that offers unlimited rides exclusively on weekends. Because casual riders primarily use the service on Saturdays and Sundays, this targeted pass will serve as an affordable, low-barrier stepping stone toward a full annual membership

3

Launch Targeted Location-Based and In-App Marketing: Focus advertising efforts in the tourist destinations and parks where casual riders frequently start and end their trips. Place physical promotional materials directly on the bikes in these high-traffic areas. Additionally, trigger in-app push notifications for casual riders promoting the new weekend subscription while they are using the app

Appendix

1. Although annual members ride more frequently overall, their station data shows fewer recorded entries than casual riders. This is partly explained by electric bike usage — electric bikes can be docked at any traditional Cyclistic station, approved public bike rack, or other public property such as light poles and street signs within the service area. Rides ending outside a formal docking station are not captured in data, which reduces the number of station records in the dataset
2. January 2026 data was unavailable and is therefore excluded from this analysis
